

Stamp Tiff Image files with a Number without obstructing Data

Tiff Numbering is a program that is designed to stamp Tiff images with a number (commonly referred to as a "Bates Stamp") in a manner where it does not obstruct any portion of the image. The image can maintain its original size and have the current image shrunk to allow for a border to place the number or the image can remain the same and have a border placed around it for the number which increases the image size.

The stamped number will be the file name without an extension. Optionally it can have a prefix and a separator, this prefix and separator can also become a new file name. This is all done in a batch process where the user selects a folder and all files are processed. The output file can be either a tiff or image only PDF.
